

Playground Quick Reference

Version 0.5 - a small visual-programming library built on pygame-ce

The basic idea

Import **playground** as **p**, define a one-time **setup()**, define a repeating **draw()**, then call **p.run()**.

Your first sketch

```
import playground as p

def setup():
    p.size(640, 400)

def draw():
    p.background("white")
    p.fill("tomato")
    p.circle(320, 200, 80)

p.run()
```

What happens

setup() runs once. It is normally where you create the window with **p.size(...)**.

draw() runs again and again, up to the selected frame rate. Put drawing commands - and, for now, animation changes - here.

p.run() starts the sketch. In v0.5 it automatically finds the standardized **setup()** and **draw()** functions, so you do not pass them as arguments.

Important for v0.5

There is **no update() callback** in this version. If an object moves, update its variables inside **draw()**.

Window setup

p.size(width, height)	Create or resize the window.
p.size(..., title="...")	Set the window title.
p.size(..., fps=30)	Choose the target frames per second. Default: 60.
p.width, p.height	Current window size. These are live values.

Coordinates and drawing

The origin **(0, 0)** is the top-left corner. **x** increases to the right and **y** increases downward.

```
# useful positions
left = 0
right = p.width
top = 0
bottom = p.height
center_x = p.width / 2
center_y = p.height / 2
```

Shape functions

p.circle(x, y, diameter)	Circle centered at (x, y). The last argument is the diameter, not the radius.
p.ellipse(x, y, width, height)	Ellipse centered at (x, y).
p.rect(x, y, width, height)	Rectangle whose (x, y) is the top-left corner.
p.line(x1, y1, x2, y2)	Line from one point to another.
p.point(x, y)	Draw a point using the current stroke.

Argument order examples

```
p.circle(100, 80, 40)           # x, y, diameter
p.ellipse(220, 80, 100, 50)    # center x, center y, width, height
p.rect(40, 160, 120, 60)       # top-left x, y, width, height
p.line(220, 160, 340, 220)    # x1, y1, x2, y2
```

Drawing many things with for

```
for x in range(60, 601, 60):
    p.circle(x, 200, 30)
```

A decision with if

```
if p.mouse_x < p.width / 2:
    p.fill("tomato")
else:
    p.fill("skyblue")

p.circle(p.mouse_x, p.mouse_y, 40)
```

Colors, fill, stroke and text

Playground passes color values directly to pygame-ce. The recommended beginner forms are named colors, RGB tuples, and hexadecimal strings. A complete named-color appendix appears at the end of this guide.

Named colors

```
p.background("white")
p.fill("tomato")
p.stroke("navy")
```

RGB colors

An RGB tuple contains red, green and blue values from 0 to 255.

```
p.fill((255, 0, 0))      # red
p.fill((0, 180, 100))   # custom green
p.fill((120, 80, 200))  # custom purple
p.background((245, 245, 240))
```

Hex colors

```
p.fill("#F05A45")
p.stroke("#203040")
```

Fill and outline

p.fill(color)	Set the inside color of later shapes.
p.no_fill()	Do not fill later shapes.
p.stroke(color)	Set the outline / line color.
p.no_stroke()	Do not draw outlines or lines.
p.stroke_width(pixels)	Set outline and line thickness. Minimum is 1.

```
p.fill("gold")
p.stroke("black")
p.stroke_width(3)
p.circle(200, 120, 100)

p.no_fill()
p.stroke("tomato")
p.rect(300, 70, 120, 100)
```

Text

p.text_size(size)	Set the size used by later text.
p.text(message, x, y)	Draw text at (x, y). Objects are converted to text automatically.
p.text(..., color=...)	Optionally choose a color just for this text.

```
p.text_size(28)
p.fill("black")
p.text("Hello", 30, 40)
p.text(p.frame_count, 30, 80, color="navy")
```

Animation and changing variables

Because **draw()** repeats, changing a variable a little each frame creates motion.

```
import playground as p

x = 50

def setup():
    p.size(640, 400)

def draw():
    global x

    p.background("white")
    p.fill("tomato")
    p.circle(x, p.height / 2, 40)

    x += 2

p.run()
```

Why global x?

x is created outside **draw()**. Because **draw()** assigns a new value to it, Python requires **global x** inside the function.

Clear the old frame

Calling **p.background(...)** near the start of **draw()** clears the previous frame. Leave it out if you intentionally want trails.

Bounce with if

```
x = 50
speed = 3

def draw():
    global x, speed

    p.background("white")
    p.circle(x, p.height / 2, 40)

    x += speed

    if x > p.width - 20 or x < 20:
        speed = -speed
```

Useful animation values

p.frame_count	Number of completed frames since the sketch started.
p.delta_time	Seconds taken by the previous frame. Useful for time-based motion.
p.stop()	Ask the main loop to stop.

```
# move at about 120 pixels per second
x += 120 * p.delta_time
```

Mouse, keyboard and useful helpers

Mouse values are updated automatically before each call to **draw()**.

p.mouse_x	Current mouse x-coordinate.
p.mouse_y	Current mouse y-coordinate.
p.mouse_pressed	True when any of the first three mouse buttons is currently held.

```
if p.mouse_pressed:
    p.fill("tomato")
else:
    p.fill("skyblue")

p.circle(p.mouse_x, p.mouse_y, 30)
```

Keyboard

p.key_down(key) is True while a key is held. v0.5 recognizes **left**, **right**, **up**, **down**, **space**, **enter**, **escape**, and single-character keys such as **a** or **7**. Escape also closes the sketch.

```
if p.key_down("left"):
    x -= 3

if p.key_down("right"):
    x += 3

if p.key_down("space"):
    p.fill("gold")
```

Math / utility helpers

p.random(high)	Random floating-point number from 0 up to high.
p.random(low, high)	Random floating-point number between low and high.
p.constrain(value, low, high)	Keep a value inside a minimum and maximum.
p.distance(x1, y1, x2, y2)	Straight-line distance between two points.

```
x = p.random(p.width)
y = p.random(p.height)

x = p.constrain(x, 20, p.width - 20)

d = p.distance(x, y, p.mouse_x, p.mouse_y)
```

Combine input with drawing

```
if p.mouse_pressed:
    p.fill("tomato")
else:
    p.fill("skyblue")

p.circle(p.mouse_x, p.mouse_y, 40)
```

One-page cheat sheet

This page lists the public v0.5 student-facing API.

SETUP / RUN		LIVE VALUES	
<code>p.size(w, h)</code>	Create/resize window.	<code>p.width / p.height</code>	Window dimensions.
<code>p.size(w, h, title="...")</code>	Window title.	<code>p.mouse_x / p.mouse_y</code>	Mouse position.
<code>p.size(w, h, fps=60)</code>	Target frame rate.	<code>p.mouse_pressed</code>	Any mouse button held.
<code>p.run()</code>	Run <code>setup()</code> once, then <code>draw()</code> repeatedly.	<code>p.frame_count</code>	Frames completed.
<code>p.stop()</code>	Stop the sketch loop.	<code>p.delta_time</code>	Seconds for previous frame.
DRAWING		INPUT	
<code>p.background(color)</code>	Clear/fill the whole window.	<code>p.key_down("left")</code>	Named key held?
<code>p.circle(x, y, d)</code>	Centered circle.	<code>p.key_down("a")</code>	Single-character key held?
<code>p.ellipse(x, y, w, h)</code>	Centered ellipse.		
<code>p.rect(x, y, w, h)</code>	Top-left rectangle.	HELPERS	
<code>p.line(x1, y1, x2, y2)</code>	Line.	<code>p.random(high)</code>	Random 0..high float.
<code>p.point(x, y)</code>	Point.	<code>p.random(low, high)</code>	Random low..high float.
STYLE		<code>p.constrain(v, lo, hi)</code>	Clamp value to range.
<code>p.fill(color)</code>	Set fill.	<code>p.distance(x1,y1,x2,y2)</code>	Distance between points.
<code>p.no_fill()</code>	Disable fill.	COLOR FORMS	
<code>p.stroke(color)</code>	Set line/outline color.	"tomato"	Named pygame-ce color.
<code>p.no_stroke()</code>	Disable stroke.	(255, 80, 70)	RGB tuple.
<code>p.stroke_width(n)</code>	Stroke thickness.	"#FF5046"	Hex string.
<code>p.text_size(n)</code>	Text size.	CALLBACKS IN v0.5	
<code>p.text(msg, x, y)</code>	Draw text.	<code>setup()</code>	Optional; called once.
		<code>draw()</code>	Required; called repeatedly.
		<code>update()</code>	Not provided in v0.5.
CONSTANTS / STATE			
<code>p.width / p.height</code>	Live values, not constants.		
<code>p.mouse_x / p.mouse_y</code>	Live values, not constants.		
<code>p.frame_count / p.delta_time</code>	Live values, not constants.		
<code>p.__version__</code>	Library metadata: 0.5.0.		

Remember

Use **p.** before playground functions and live values: **p.circle(...)**, **p.width**, **p.mouse_x**, **p.run()**. Python variables such as **x** remain ordinary Python variables.

Named colors and other fixed names

Every color argument in playground v0.5 is passed to pygame-ce. For students, the three most useful forms are a named string, an RGB tuple, or a #RRGGBB hex string.

```
p.fill("tomato")          # named color
p.fill((255, 99, 71))     # RGB
p.fill("#FF6347")        # HEX
```

Named colors

The appendix on the following pages lists the named strings accepted by the pygame-ce color table, with their equivalent RGB and HEX values. Colors are organized by visual family instead of alphabetically, so similar colors appear together. Use the lowercase spelling shown in the table.

Other color values pygame-ce accepts

(R, G, B)	Three integers from 0 to 255.
(R, G, B, A)	RGBA tuple; A is alpha/opacity. Alpha behavior depends on the surface being drawn to.
[R, G, B] / [R, G, B, A]	Lists are also accepted by pygame-ce.
"#RRGGBB"	HTML-style hexadecimal string.
"#RRGGBBAA"	Hexadecimal string including alpha.
"0xRRGGBB" / "0xRRGGBBAA"	Alternative hexadecimal string form accepted by pygame-ce.

Constants and live values in playground v0.5

There are **no student-facing uppercase constants** such as RED, LEFT, or CENTER in v0.5. Colors and keys are supplied as strings. The following values are exposed by the module, but they are **live state**, not constants:

p.width, p.height	Current sketch dimensions.
p.mouse_x, p.mouse_y	Current mouse position.
p.mouse_pressed	Current mouse-button state.
p.frame_count	Number of completed frames.
p.delta_time	Seconds taken by the previous frame.
p.__version__	Package metadata; v0.5 reports "0.5.0".

Fixed key-name strings

p.key_down(...) recognizes "left", "right", "up", "down", "space", "enter", "escape", and any single-character key such as "a" or "7". These are strings, not constants.

Named colors - Reds & pinks

Colors are grouped by visual family and ordered by actual hue/lightness, not by name. Name, RGB and HEX are equivalent ways to request the same color.

Name	RGB	HEX	Name	RGB	HEX
rosybrown1	(255, 193, 193)	#FFC1C1	coral3	(205, 91, 69)	#CD5B45

gray100	(255, 255, 255)	#FFFFFF
grey100	(255, 255, 255)	#FFFFFF
white	(255, 255, 255)	#FFFFFF

Color-name patterns worth knowing

The long list is easier to remember once you notice a few patterns:

gray0 ... gray100	A grayscale ramp from black to white. The equivalent grey0 ... grey100 spellings are also available.
name1 ... name4	Many X11 color families have numbered variants. For example tomato1, tomato2, tomato3 and tomato4.
gray / grey	Both spellings appear in many named colors: darkgray/darkgrey, slategray/slategrey, and so on.
aqua = cyan	Different names can map to exactly the same RGB value.
fuchsia = magenta	Another pair of equivalent names.

```
p.fill("gray25")
p.fill("tomato3")
p.fill("darkslategrey")
p.fill("aqua")
```

Recommendation for class

For ordinary sketches, prefer memorable base names such as white, black, red, blue, green, orange, gold, tomato, coral, skyblue, navy, violet, purple and darkgray. Use RGB or HEX when you need an exact custom color.

Source note

playground v0.5 forwards color values to pygame-ce. The named-color vocabulary follows pygame-ce 2.5.8 documentation and its X11-style color dictionary. This guide adds RGB/HEX equivalents for convenience.
